## 32/35.i Info Hyd. pneum spring assy W110, W111, W108

32/35.i Info Hyd. pneum spring assy W110, W111, W108

Seit ca. 1967 wird als Abhilfe gegen ein "hängendes Fahrzeugheck" bei beladenen Fahrzeugen (Typen mit Pendelachse) der Hydropneumatische Ausgleichsdämpfer "Boge-Hydromat" an Stelle der Ausgleichsfeder über dem Differential eingesetzt.

Einsendung Ihres Altteils, Annahme und Identifikation

Technisch gesehen ist es der Vorläufer der hydraulischen Niveauregulierung in einem Dämpfergehäuse ohne eine externe Öldruckpumpe.

Im liegend eingebauten, kompakten Gehäuse führt das Eintauchen bei Last zu einer Ventilreaktion und bewirkt bei nachfolgenden Federvorgängen ein Umpumpen von Öl gegen einen membrangetrennten Gasdruckraum.

Ein neuer oder fachgerecht überholter Dämpfer hebt das Fahrzeugheck nach kurzer Fahrstrecke (einigen Feder-Vorgängen) auf das normale Niveau.

Überholung Ihres Altteils nach Prüfung, Befund+Angebot. Artikelnummer **832807**

Vor der Fahrt

nach ca. 300 m

Mit Wegfall der letzten Pendelachs- fahrzeuge (Ende 1972) wurde der "Hydromat" obsolet; Fahrzeuge mit Schräglenkern erhielten bei Bedarf Niveauregulierende Dämpfer und einen Motorabtrieb für eine externe Hydraulikpumpe.

Neuteil **832007**  
Liefersituation bitte erfragen

Heute können Sie den hydraulischen Ausgleichsdämpfer als Neuteil bestellen oder Ihr Gebrauchtteil zwecks "Befund und Überholung nach Angebot" zu uns einsenden. Wir bitten um Verständnis, im Vorwege nur einen PreisBEREICH angeben zu können. Die Arbeiten erfolgen in einem ZF-Sachs Fachbetrieb, der über die erforderlichen Boge-Spezialeinrichtungen verfügt. Kosten von Prüfung und Befund werden beim Überholungs-Auftrag verrechnet. Vorsicht: der Ausbau des Teils kann (wie jede Federn-Demontage) gefährlich sein, bitte beachten Sie die Montagehinweise in der Werkstattliteratur. Von einer Dämpferzerlegung durch fachunkundiges Personal wird dringend abgeraten.

## 40, Wheel lug bolts M12, assorted by overall length

Easy view display for older MB cars: all bolts with ball band and thread M12 x 1.5 and key width 17. This makes it easier to sort LOOKING AT TOTAL LENGTH (length over everything). Various axle/wheel combinations led to the bolts shown here between 1959 and 1989. As a rule of thumb: when screwing in, the bolt should reach its seat about 6 to 7 whole rotations into the thread. with less load-bearing thread, the load-bearing capacity is not achieved, with longer screwing there can be contact with other parts (endangered: rear handbrake, front brake disc e.g. with type 230SL). In the mid-1980s, a system change over MB front axles took place: former wheel hub flange (threaded seat) attached to the rim (brake disc screwed separately on the inside), later brake disc on wheel hub, between rim and threaded seat. (For the hub diameter, see also the information board on brake discs). The design of rim plates is not only material dependent, but different manufacturers (example baroque replica) designed their own plates with consequences for the bolt length and deviations from the MB principle ball band /SW17

wheel bolt, total 86mm, zinc plated, without chrome	<a href="#">740807</a>	€ 10,53

## 49a Exhaust 250/280SE/C, mild steel

49a Exhaust 250/280SE/C, mild steel

In this illustration: the LHD double tube version (continuous double pipe) was used from the injection model 250SE W108 or W111 and thereafter for all 280S/SE as a modernization/successor of the one-pipe plant (types up to 250S). Since no longer all parts are available from industrial after-production, adaptation can be useful:

- Combination clamped components with those intended for welding
- Conversion of front or middle tubes to other ground platform (convertible) for adaptation
- Conversion of SE front tubes for adaptation to carburetor models.
